

## Summary

Pre-diploma practice is connected with the diploma project of the bachelor on the topic "Electromagnetic fluid counter". In pre-diploma practice, I have used the theoretical skills had been acquired at the university and the knowledge have been provided by the practice leader.

The enterprise is used its own experience to make products and the products of other firms. The firm transfers the products of its own development and certification into production to other manufacturers and involves dealers to introduce their products such as commercial gas accounting units, automation systems, gas odorization complexes and others.

At the enterprise I was shown achievements and obtetions in the field of electromagnetic meters and heat supply. Today electromagnetic meters are not a shortage but they are not used in everyday life. The enterprise tries to introduce an electromagnetic counter in the apartments and in other different spheres of human activity. The task of developing and introducing an electromagnetic meter is to increase accuracy, calibration and adjustment. Therefore, today it is becoming relevance to study and develop electromagnetic meters.
